

SNMP / MODBUS Integration

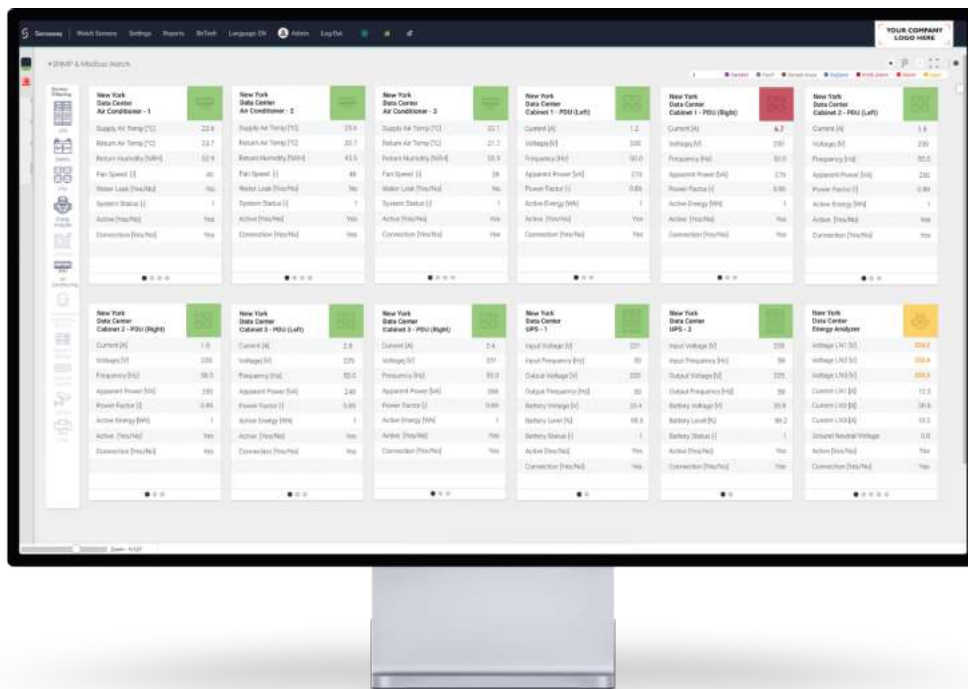

Monitoring of 3rd Party Devices

Sensaway®

You can easily monitor, get reports and manage your infrastructure equipment located in the critical areas from the Sensaway platform with SNMP/MODBUS IP protocols, regardless of brand. You can filter your devices on the basis of both location and device category and monitor with the sensor data you want.

You can also create separate alarm rules and scenarios for each sensor.

You can monitor and manage all brand-independent SNMP supported devices in your environment via Sensaway central management software on the basis of device and sensor with SNMP license packages.

What may you Monitor ?

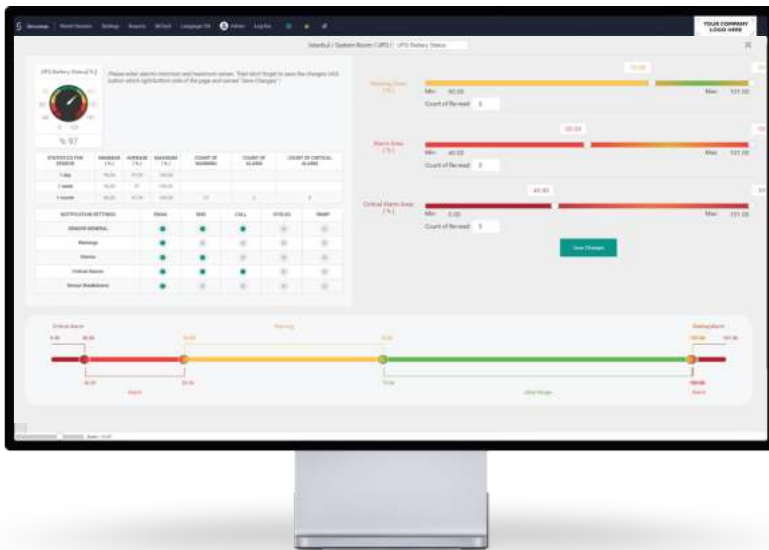

- IP PDU
- Air conditioner
- Power Analyzer
- CRAC / CRAH
- UPS
- Generator
- ATS / STS
- Various IT Devices

It supports SNMP V1 / V2 / V3.

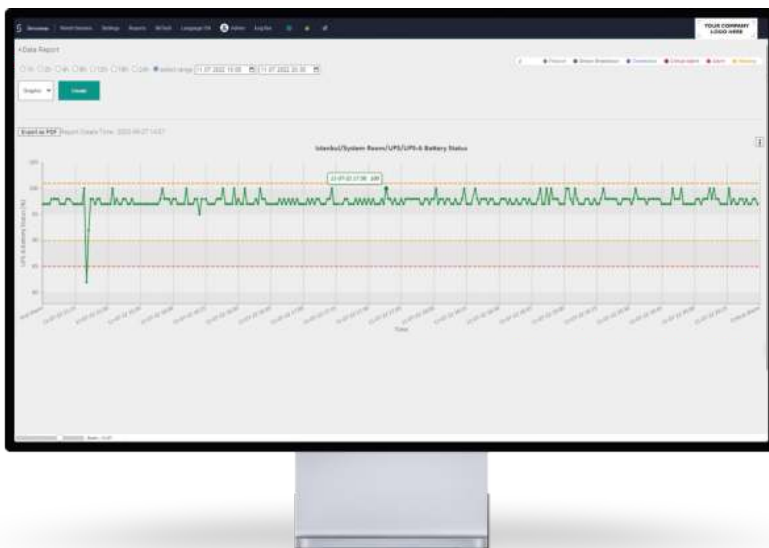

Report and Alert Rules

Sensaway®

You can receive data from your SNMP/Modbus supported devices through Sensaway Management Software, as well as specify alarm threshold ranges for each parameter separately. You can customize your notifications (mail, SMS, call, syslog, SNMP trap) by creating alarm scenarios according to these alarm thresholds.

You can create graphical and table reports at the time intervals you have determined and print them in PDF format. Furthermore, you can also access analysis reports where you can see the event start and end times for each sensor separately.

You can also monitor your SNMP/Modbus supported devices, see your alarm thresholds and get summary reports at any time via the Sensaway Mobile application. Furthermore, you can also receive your notifications via the mobile application if you wish.
